

Apply
Unifies to call method
difference is we pass arg in arr

- 1) fn/variable/defn i create in a file, can only be used in that file, export → to send
 - 2) import → to receive
→ use
- implemented first core level in JS, we won't have to import/export to or that fn.
- 2016 → call, apply, mybind
- 2017 X
- welcome (call) — JS
welcome (mybind) — own at core

carBesc.call(car) bind

→ return a fn
which has 'this'
binded to an obj
and we can call
it as per need
